

ONC-305-301

Recruiter Portfolio Summary

What this project demonstrates for biostatistician/statistical-programmer roles

Document	Recruiter Portfolio Summary	Study	ONC-305-301
Version	1.0	Status	Final simulated package
Data cut-off	2026-01-31	Database lock	2026-02-15
Author	Luke Johnston	Classification	Portfolio demonstration
Purpose	Biostatistics/statistical-programming portfolio	Data	100% simulated; no patient data

Important: this is a simulated portfolio package designed to demonstrate biostatistics, statistical programming, reproducibility, and regulatory-document writing. It is not a real clinical trial and is not clinical evidence.

Why this project stands out

- It is not just a survival-analysis notebook: it is an end-to-end analysis package with SAP, CSR-style report, ADaM-style datasets, TLFs, validation and reviewer documentation.
- It demonstrates oncology-specific endpoints: PFS, OS, ORR, DCR, TEAEs, grade ≥ 3 TEAEs, serious AEs, discontinuations and laboratory shifts.
- It proves reproducibility: a single command regenerates data, analysis datasets, outputs and reports.
- It shows communication skill: technical analyses are packaged into documents that a statistician, statistical programmer, clinical reviewer or recruiter can understand.

Capability	Evidence in repository
Protocol/SAP thinking	Professional SAP with estimand, endpoints, censoring, populations and multiplicity
Survival analysis	PFS and OS KM/log-rank/Cox outputs; PFS HR 0.69 (0.56, 0.86); OS HR 0.67 (0.51, 0.88)
Oncology safety	TEAE by SOC/PT, grade ≥ 3 , SAE, discontinuation, fatal event and lab-shift outputs
ADaM/CDISC awareness	ADSL, ADTTE, ADRS, ADAE, ADLB, define-like XML and traceability matrix
Validation	62 PASS / 0 WARN / 0 FAIL QC status
Programming	Python executable pipeline plus SAS/R templates for regulated-workflow discussion

CV bullets

- Built a simulated Phase III oncology statistical-submission portfolio with professional SAP, CSR-style statistical report, ADaM-style ADSL/ADTTE/ADAE/ADRS/ADLB datasets, TLFs, listings, figures, validation report, reviewer guide and reproducible Python/SAS/R programming structure.
- Implemented PFS/OS Kaplan-Meier, log-rank and Cox analyses; ORR/DCR exact-CI response summaries; exposure, disposition, protocol-deviation, TEAE, SAE, grade ≥ 3 AE, AE-discontinuation and laboratory-shift outputs.
- Created analysis results metadata, source-to-ADaM traceability, define-like metadata, QC issue log and program validation tracker to mirror regulated pharma analysis workflows.

Interview explanation

- I designed the portfolio to show I understand the whole chain from protocol question to SAP, estimand, ADaM derivation, TLF production, validation and reporting.
- The project is intentionally simulated, so it avoids patient data while still letting me demonstrate clinical-trial reasoning and programming discipline.
- I can discuss both the statistical methods and the operational workflow: derivations, flags, denominators, censoring, subject-level AE counting, QC and traceability.
